

Less is more!

New innovative technique reduces our carbon footprint.

Say hello to the new generation PVC eco cables. We are always striving towards becoming more environmentally friendly in all that we do. At our plant in Kistelek, Hungary, our R&D engineers have succeeded in developing cables from mixing new PVC with reused compounds. That way we are using less material and energy, improving in waste management and reducing the emission of greenhouse gases into the atmosphere – while keeping the same high quality! Big journeys begin with small steps.

We're happy to tell you more:
